Tim/Eric

The zoom levels on the ASPECT tile services go from level 0-19 (ArcGIS tiling scheme), with level 19 being 1:1,128 scale. I worked with Josh and he found that it creates a cache at each level so it is probably already a pretty large file size on the server. Can you produce additional levels at smaller scales if needed? Josh found a post on making the tiles visible at all scales so that imagery will persist even if zoomed in beyond the max level.
